

Bedirhan Gonul

The company I used for this assignment is called IEX Group which is a newly created stock exchange that is traded on every day. It is currently the place that I work at as an intern on the Enterprise Infrastructure team.

The company was founded on the idea of a fair and simple stock exchange that stayed true to its words when it came to building a trustworthy trading platform. From what is only publicly available I can tell you that the languages that the engineering teams use are primarily Java and Python as well as the use of Node.js.

Though my role and responsibilities are fairly low risk I do see the way in which a company like that tries to be a step ahead when it comes to technological advances as well as when it comes reinventing certain parts of the financial sector.

I see that the hiring process was quite thorough in every aspect whether the topic discussed is technical general or practical.

Even though the company is quite small they have multiple teams that are always trying to move the company forward while still staying true to the company's values.

Like we discussed in class I see that there are numerous yet useful number of meetings between teams whether Dev, System, or Infrastructure engineers that take place throughout the week that is meant to be on the same page when it comes to the development and maintenance of certain projects.

They certainly have the feel of a focused underdog feel as a company as they have to compete with much larger already well established Stock Markets as well as try to change the business culture on Wall Street.
